

CNotesMobile

Maintaining operational excellence standards in the field through mobile operator rounds allows for safe, reliable and profitable operations and is critical for achieving regulatory compliance.

CSoft Technologies' CNotesMobile™ delivers a powerful, yet easy-to-use iOS, Android and Windows mobile device-based application that allows authorized personnel to scan RFID/Barcodes to prompt questions and provide answers for process and equipment issues helping to mitigate costly future problems. Operator Rounds questions can be configured based on user responses. A routine duties tasks calendar can be managed to track field operations tasks performance.

Reports can be generated, displayed, printed and automatically emailed with the ability to look at your entire field operations or a specific unit, for entries that are outside the specified operating targets, or notes for the employees.

Below is a listing of the key features of CNotesMobile:

- Multi-language support.
- Real time field worker operations and maintenance work status updates with wireless connectivity.
- Ability to interface with critical plant systems such as Data Historians, Lab, SAP, Alarms, Maximo, MOCs and more to both view data from and update back to external systems for understanding plant operational status in detail.
- Best practices and procedures can be shared for rapid training of new field workers and for knowledge retention.
- Manage Incidents and Events by recording near misses, logging first reports of incidents, record equipment failures and conduct incident investigations in the field.
- Reduce manual data entry by including visual inspection pictures, logging process checks while doing rounds while accessing safe operating limits to reduce deviations and improve process safety.
- Improve shift handover communications and reduce risk.
- Enable safe start up of equipment by initiating work orders, permits and notifications based upon field inspections.
